6.3 The Multiplication Principle

Example

A fair coin is flipped three times. How many different outcomes are there for this experiment?

$\underline{2} \times \underline{2} \times \underline{2} = 8$

Multiplication Principle:

Suppose a task T_1 can be done N_1 ways and a task T_2 can be done N_2 ways and so on until task T_k can be done N_k ways. Then the number of ways of performing the tasks $T_1, T_2, \ldots T_k$ is given by the product $N_1 \cdot N_2 \cdot \ldots \cdot N_k$

Factorials: $n! = 1 \cdot 2 \cdot 3 \cdot \ldots \cdot (n-1) \cdot n$. Note that $0! = 1$

Example

How many different license plates are possible where

a) The first characters is a letter, the next two characters are digits and the last three characters are letters?

$\underline{26} \times \underline{10} \times \underline{10} \times \underline{26} \times \underline{26} \times \underline{26} = (26)^4 \times (10)^2$

b) The first two characters are letters, the next characters is a digit, the next a letter and the last three are digits?

$_\ _\ _\ _\ _\ _\ _ = (26)^3 \times (10)^4$

c) No characters are duplicated in part (b)

$\underline{26}\ \underline{25}\ \underline{10}\ \underline{24}\ \underline{9}\ \underline{8}\ \underline{7} =$

Example
You have a group of 15 different books. Five are math books, four are chemistry and six are history books. How many different arrangements are possible if books of the same type are kept together?

Math	History	Chem
5	6	4

Example
A sales person has 6 prospects. How many ways can she arrange her schedule to see all 6?

$\underline{6} \times \underline{5} \times \underline{\ } \ \underline{\ } \ \underline{\ } \times \underline{1} = 6!$

Example
How many different 4 digit numbers can be made from the digits
1, 2, 3, 4, 5, 6, 7

a) If there are no restrictions?

b) If the number must be even?

c) If it is even and there are no repeats?

d) If four of the same digit is not allowed?

$\underline{7} \ \underline{7} \ \underline{7} \ \underline{7} \rightarrow 7^4 - 7$

$\underline{3} \times \underline{2} \times \underline{1} = 6 = 3!$

6.4 Combinations and Permutations

Example
How many ways can 10 students be seated in a row of 10 chairs?

Example
How many ways can 4 of 10 students be seated in a row of 4 chairs?

Permutations: If we have a finite set of n elements and we want to place r of them in an arrangement, we say the number of permutations of n things arranged r at a time is $P(n, r)$.

Example
How many ways can gold, silver and bronze medals be awarded in a race of 12 people?

Example
How many ways can a group of 4 students be chosen from 10 students?

Combinations: If we have a finite set of n elements and we want to take r of them in an group, we say the number of combinations of n things grouped r at a time is $C(n, r)$.

Example
How many ways can a hand of 6 clubs be chosen from a standard deck?

Example
From a group of 12 people, how many ways can a committee of 4 be formed if one person is the chair of the committee?

Example
A bag contains 6 blue, 1 green and 3 pink jelly beans. You choose 3 at random. How many samples are possible in which

a) the jelly beans are all blue?

b) the jelly beans are all green?

c) the jelly beans are all pink?

d) there are 2 blue and 1 pink?

e) How many ways to choose 3 jelly beans?

f) How many ways to choose no blue?

g) How many ways to choose at least one blue?

Example
A class of 12 students will divide into 3 teams of 4. How many ways can this be done?

Example
A school is putting together a committee. The committee will have a chair and an assistant chair chosen from a group of 10 teachers, two parents chosen from a group of 15 parents and two students chosen from a group of 20 students. How many different committees are possible?

Example
You are dealt a hand of four cards from a well-shuffled standard deck of 52 cards.
(a) How many ways can you be dealt at least 3 spades?

(b) How many ways can you be dealt exactly two diamonds or exactly two clubs?

Example
How many different "words" can be made from the letters in MISSISSIPPI?

Example
Seven children stop at a restaurant where they have a choice of a cheeseburger, a hot dog, pizza or a burrito. How many different purchases are possible?
